## **Abstract**

A disposable clothing is used for protection against liquids or microorganisms, in particular for medicine, chemistry or biotechnology. The
clothing comprises, in particular a front part and sleeves (20) connected
thereto. The clothing (10) is provided with an external layer (12) in the
form of a non-woven air-permeable material. A barrier layer which is
selected such that it is air permeable but liquid-proof, is applied to at
least the side of the external layer (12) which is oriented towards a
person wearing the clothing (10). The barrier layer is, at least in places,
connected to the external layer. The non-woven material of the external
layer (12) is a laminated material comprising spundbond and meltblown
layers.
